

# PROBLEM SOLVING 1-

Agenda :

- ↳  $\log(n)$  complexity
- ↳ Prime number (optimize)
- ↳ Euclidean distance
- ↳ Assignment questions

---

★ Time Complexity in Binary Search

#  $li = \begin{matrix} & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\ [2, & 5, & 6, & 8, & 10, & 13, & 16, & 17] \\ & s & & m & & & & e \end{matrix}$

$$mid = (s+e) // 2 \Rightarrow 3$$

★ Best case :

$$target = 8$$

$$\# \text{ Time Complexity} = O(1)$$

## # Worst Case Time Complexity :

128  $\rightarrow 2^7$   
 $\downarrow$   
64  
 $\downarrow$   
32  
 $\downarrow$   
16  
 $\downarrow$   
8  
 $\downarrow$   
4  
 $\downarrow$   
2  
 $\downarrow$   
1

$$2^{10} \downarrow \log_2 2^{10} = 10$$

# How many times you divide a number by 2 to get 1.

$$\# \quad b^y = x$$

$$\boxed{\log_b x = y}$$

$$\# \quad \log_2^{128} = 7$$

$$\# \quad \log_2^n = y$$

$$\# \log_2^n \rightarrow \boxed{\log n}$$

# In here base is 2 because in Binary Search we always divide our search space into 2 parts.

---

Q.1)

n = 50  
a = 0  
i = n

while i > 1 :  
    a += 1  
    i //= 2

# i = 50  $\xrightarrow{1/2}$  25  $\xrightarrow{1/2}$  12  $\xrightarrow{1/2}$  6  $\dots$  1

#  $(\log n)$  Ans:

---

# Question →

for i in range(1, n):  $\approx n$  times  
    for j in range(1, n//4):  $\approx n/4$   
        for k in range(1, n):  $\approx 1$   
            break

$$\# \quad T(c) \approx n \times \frac{n}{4} \times 1 \Rightarrow \frac{n^2}{4}$$

$$\# \quad T(c) = O(n^2) \quad \underline{\text{Ans}}$$

$$\# \quad \begin{aligned} n &= 10^8 \\ n/2 &= 5 \times 10^7 \end{aligned}$$

$$\# \quad \begin{aligned} n &= 10^{16} \\ n/4 &= 2.5 \times 10^{15} \end{aligned}$$

Question :

```

c = 0
for i in range(1, n+1): ≈ n
    for j in range(1, n+1): ≈ n
        for k in range(n//2, n+1, n//2):
            c += 1 ≈ O(1)

```

$$n = 100$$

# After 1<sup>st</sup> jump there will be no range left for you to jump.

$$\# \quad TC = n \times n \times 1 \Rightarrow n^2$$

#

$$TC = O(n^2)$$

★

Prime Number :

#

i)

A number divisible by 1 &amp; itself

ii)

A number having exactly 2 different factors.

#

$$n = 11$$

$$11 : 1, 11$$

yes

#

$$n = 10$$

$$10 : 1, 2, 5, 10$$

No

#

If a number has any factors between  $2 - (n-1)$  : Not prime. else prime.

#

$$n = 20$$

$$20 : 1, 2, 4, 5, 10, 20$$

$$40 : 1, 2, 4, 5, 8, 10, 20, 40$$

# We can check till  $n/2$  numbers

---

★ Improvised :

#  $n = 100$

$$\sqrt{100} \Rightarrow 10$$

#  $10 \rightarrow 2, 3, 4, 5, 6, 7, 8, 9, 10$

#	77	$\rightarrow$	7	not prime
	76	$\rightarrow$	2	not prime
	99	$\rightarrow$	3	not prime
	48	$\rightarrow$	2	not prime
	73	$\rightarrow$	---	Prime

---

★ Euclidean distance :

# Cartesian plane

$$\# \quad P_A(x, y)$$

$$\# \quad A(2, 3) \quad \rightarrow \quad x_1 = 2, \quad y_1 = 3$$

$$\# \quad B(10, 5) \quad \rightarrow \quad x_2 = 10, \quad y_2 = 5$$

$$\# \quad d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

$$\# \quad d = \sqrt{(10 - 2)^2 + (5 - 3)^2}$$

$$d = \sqrt{(8)^2 + (2)^2}$$

$$d = \sqrt{64 + 4}$$

$$d = \sqrt{68} \quad \underline{\underline{\text{Ans}}}$$

★ KNN : k- nearest neighbors
